

8:00 - 8:30 1. What is a low-load building?
 Dr. Straube will review enclosure specifications including insulation levels, airtightness, windows, and internal gains, and then discuss the approach to determining heating and cooling power densities.

8:30 - 10:00 2. Existing solutions
 John will then examine how a typical furnace and air conditioning system should be expected to perform in a low-load enclosure. The relationship between enclosure improvements and mechanical system performance will also be explored for multi-unit residential buildings, including "stacked town houses" (better enclosure, smaller spaces) and large single family homes (better enclosure but may not be low load).

10:00 - 10:15 -- morning break --
 10:15 - 12:00 3. Mechanical equipment design choices for heating, ventilation, and hot water
 Turning to the mechanical systems, John will review the choices that are available. Systems to be considered will include ground-source heat pumps, air-source heat pumps, ductless mini-splits, ducted mini-splits, air-to-water heat pumps, combo (or combi) systems, and solar hot water systems. The pros and cons of each will be considered. The important of looking at domestic hot water will be emphasized.

12:00 - 1:00 -- break for lunch
 1:00 - 2:30 Systems design: equipment, distribution, installation concerns
 The review of mechanical system options will continue in the afternoon session.

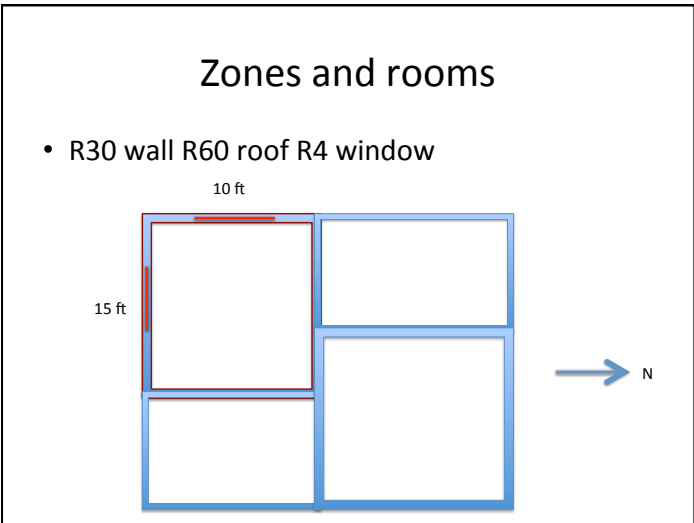

2:30 - 2:45 -- afternoon break --
 2:45 - 3:30 Some commercial building applications
 Some commercial and industrial buildings can be approached in the same way. John will conclude the seminar by discussing the applicability of the previous discussion to these building types.

3:30 - 4:00 Closing Remarks

HVAC for Low-load houses

The New World

- Heating / cooling loads shrinking!
 - Better insulation, airtightness, windows
 - Smaller homes, townhomes
 - Multi-unit = small exterior enclosure area
 - New programs: NZE, PH, E-Star V3+
- DHW can be larger energy demand
 - Only efficient appliances can reduce DHW use

Room/zone

- $(15+10) * 9 \text{ ft high} = 175 \text{ sf}$
- If 5x5 and 5x6 windows = $25+30 = 55 \text{ sf}$
- So 120 sf wall, 150 sf roof
- Heat loss (OF outdoors, $\Delta=70\text{F}$)
- Wall $120 / 30 * 70 = 280 \text{ Btu/hr}$
- Windows $55/4 * 70 = 960/\text{hr}$
- Roof $150 / 60 * (70) = 175 \text{ Btu/hr}$
- Total skin loss = 1415 (20 cfm air @ 135F)

Example Energy

Multi-unit Examples

- 20 x 30 ft = 600 sf 1 BDR interior apartment
 - 20*9 ft height = 180 sq ft enclosure area
 - 40% windows = 72 sq ft
- R20 wall, R4 window, 20 F outdoor temp.
 - $(108/20+72/4) * (70-20) = (23.4) * 50$
 - **1170 Btu/hr conduction losses (!)**
- Achieve 0.40 cfm/sq ft @75 Pa airtightness
 - 18 cfm leakage natural = **950 Btu/hr air leakage loss**
- Ventilation (New World needs it)
 - 30 cfm w/66%HRV = **1500/500 Btu/hr ventilation**

One therm = 29.3 kWh

Simple Heating Analysis Apartment

- Peak design load: 2.5-3.5 kBtu/hr (<1 kW)
 - Corner apartment up to 4-5 kBtu/hr (1.5 kW)
- Heat loss coefficient 50-70 Btu/F/hr
- If we use HDD65 = 4500
 - (50 to 70)*24*4500 = 54-75 therms < \$100/yr
 - 1465-2200 kWh/yr <\$160/yr
- If we use HDD50=1229 Negligible
- If 2.5 kBtu/hr, airflow= 50 cfm @DT=50

Low-load -1

- Peak heating loads in the range of 15-30000 Btu/hr
- Or peak heating power density of 10 to 15 Btu/hr/ft²
- DHW load often exceeds space heating load
- Mechanical ventilation almost always required due well-built airtightness

Low-Load -2

- Peak design loads are smaller than smallest *commodity* central units
 - Eg 25-30 kBtu/hr furnace
 - 1.5/2 ton AC (18-24 kBtu/hr)
 - 2 ton is the smallest efficient model
- Large sprawling houses

Distance of heat/cool/ventilate unit to the farthest point

Low Load -3

- Internal / solar gains have a BIG impact on space temperature
 - Eg. SHGC (g)=0.60
 - 6'x6'8" patio door with 80% glass
 - 6000 Btu/hr in bright sun! (1/2 ton AC in one room)
- Better zoning may be needed
 - Room by room
 - Mixing between rooms
 - Or better enclosure? (lower SHGC glazing)

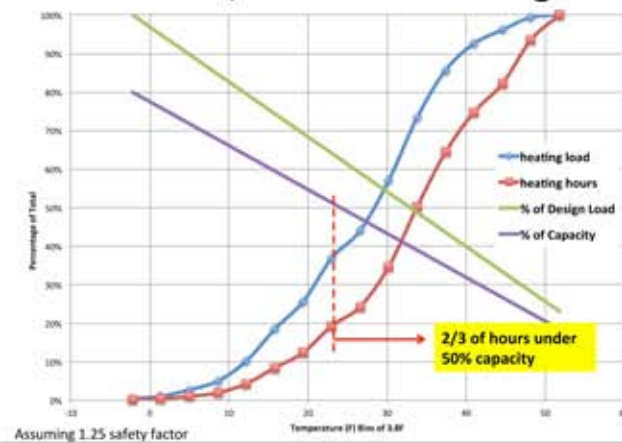

So what's the problem

- Smallest condensing furnaces are 40 kBtu/hr
- Two-stage furnaces allow for low stage fire at 30 kBtu/hr
- But most hours are at fractions of peak design
- How does the system work with a hourly heat loss of 5 to 10 kBtu/hr?
 - Runs for 10 to 20 min/hour (two fires/hour?)
 - Short cycling (wear & tear, inefficiency)
 - But must provide ductwork for 30 kBtu/hr

Zone 5/6 heating

Zone 5/6 Climate Heating

So what's the problem

- If capacity >> demand
 - Short-cycling kills AC durability and efficiency
 - Overshoot temperatures, too hot in heating, too cold in cooling
 - Need modulation or thermal mass (water)
- Min. monthly charges of two utilities
 - Can dramatically increase cost
- Cannot save money due to small size
 - Ductwork still largish (eg, say 1000 cfm)

Some Goals limit solutions

- Electric consumption is easy to measure
- Net Zero Energy houses: PV is hence preferred for on-site generation
 - Solar thermal may be as expensive per Btu!
 - Small wind turbines often more expensive power
 - Drives solutions to all-electric
- Passive House
 - arbitrary supply temperature limits
 - Calculation tool that encourages high solar gain

Domestic Hot Water

- DHW > Space heating in efficient apartments
- DHW approaches space in efficient small house
- Typical US household (census data)
 - 4000 kWh demand +/- (136 therm)
 - National *consumption* 5600 kWh (192 therm)
- Typical 5 unit + building. Use /unit
 - 2500 kWh demand (86 therm)
 - 3575 kWh/yr estimated *use* (122 therm)

HVAC for Low-Load Houses

Introduction

- No perfect solution
- Depends on building size, shape, etc.
- New or retrofit?
- Gas available or all-electric?
- Trades and equipment availability
- Money available

HVAC

- People want comfort
 - Surface temperatures, humidity
 - Heat, cool, humidity
- People assume health
 - Require fresh air = require ventilation
- Don't want to pay too much
- Don't want to do maintenance

HVAC Functions

Five Critical functions are needed

- Ventilation
 - “fresh air”
 - Dilute / flush pollutants
- Heating
- Cooling
- Humidity Control
- Air filtration / pollutant Removal
 - Remove particles from inside and outside air
 - Remove pollutants in special systems

12-12-06

23

HVAC Constraints

- Safety
 - Combustion, explosion, scalding
- Health
- Comfort
 - Temperature, humidity, air speed, noise, light
- Reliability
 - Maintainable, long term performance,
- Efficiency
 - minimum of additional energy
- Economy
 - Builder can afford

12-12-06

24

Interactions Interactions

- BEWARE:
- “Perfect” solution for heating may not solve cooling
- “Perfect” cooling solution may not solve DHW supply
- Perfect heating+cooling+DHW may do nothing for ventilation!
- We need
 - heat+ cool + DHW + vent + filtration + humidity

Ratings game

- EER
 - BTU/hr output to W input
 - 95F outdoor, 80F return
- SEER
 - Seasonal EER
 - 82F outdoor, 80F return
- COP
 - Watts out to Watts in

Simple Single Zone Residential

- All rooms the same
- No ventilation
- In AC, accidental RH control

NOT acceptable for high-performance homes

12-12-06

Minimum “Good” System

Ducts shared for ventilation, dehumidification, cooling heating

Heat or cold can be

- heat pump,
- furnace,
- solar
- wood, etc

FanCycler ensures fresh air or required amount delivered to each room

Small Residential HVAC

- Cooling DOES NOT mean humidity control
- Energy removal for lowering temperature:
 - Sensible energy
- Energy removal to condense water vapor:
 - Latent Energy
- Ratio of Sensible Heat Ratio =SHR
 - Normal cooling equipment 65% sensible
 - As enclosures become energy efficient the required SHR drops and latent becomes more important!

12-12-06 30

Heat / Cool Production

- ### Heat Production
- Boilers : heat to water
 - Old types heated water to steam and distributed
 - Modern heat water to 35C (95F) to 85C (190 F) and pump water using small electric pumps
 - Furnace: heat to air
 - Air is heated to min 40 C (110 F) and usually 50(130F)
 - Electric fan is used to move air
 - Both heat exchanger between flame to fluid
 - Fuel sources
 - Nat gas, oil, propane, wood, electric, etc.
- 12-12-06 32

Condensing Furnace

- Simple, reliable, lots of service available
- Cheap
- Usually works at near rating condition
- Eg 95% efficiency
- Spec efficient fans

Efficiency is expensive?

Goodman GMH950453BX Gas Furnace 46,000 BTU Furnace, 95% Efficient, 2-Stage Burner, 1,200 CFM Multi-Speed Blower, Upflow / Horizontal Flow

Manufacturer: Goodman
MPN: GMH950453BX
SKU: GMH950453BX
Fuel Source: Natural Gas

Price: **\$697.00**
This item is in stock

Quantity: 1 [Add To Cart](#) [Add to Wish List](#)

Small furnaces

- Most products output 40 kBtu/hr or more
 - 40 kBtu= 750 cfm @ 50F temperature rise
- Some modulating products have lower outputs, e.g.
 - York YP9C (20KBtu) \$2500
 - Trane XC95M (23 kBtu) \$3000
 - Carrier 58MVC, Rheem RGGE, Lennox SLP98DFV
- Small multi-stage can be better
 - Goodman GMH90-45 (30 kBtu) \$900
- Modulating furnaces cant “lock out” high output – require duct sizing for 65-70 kBtu!

Fully-modulating Trane Furnace

95%+
<600 cfm
<90W
130F/54C supply

But....
Min 24 kBtu/hr
+ expensive

Energy Factor (DOE)	0.99	
Dimensions	W17" x H29" x D12"	
Weight	CRCCA	77 lbs
	CRCC	67 lbs

Condensing Boilers

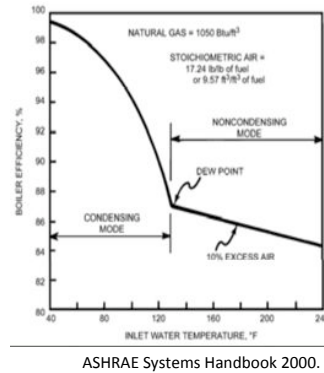

- Supply temperatures of max 140F (60C) under design conditions
 - ensures return temperature low enough to get condensing (=efficiency)
- Lower is better!
 - Outdoor reset
 - Variable speed pump + Delta T controller
 - Variable speed pump +

Boiler Combustion Efficiency

- Most combustion is >99.9% efficient
- Equipment varies on ability to extract useful heat from combustion via HX
- Heat exchanger size is important
- Temperature of entering fluid is also critical
 - Condensing furnace (72 F / 22 C)
 - Condensing boiler >90% (<110 F / 45 C)
 - Normal boiler <85% (>130 F / 55 C)

Condensation % Efficiency

- Depends on return temperature
- Terminal equipment that can return low temps aid efficiency
- Target 95-110 F (35-43 C)

Consequence

- Furnaces: return air temperatures = room temperature (70 F/21C)
 - Hence, condensing, 95%+ efficiency practical
- Boilers: depends on system design/operation
 - Radiant panels: 90-120 F / 32-48 C
 - Fan Coils: 100-180 F / 40-80 C
 - Will not condense if T > 135F/55C
 - Baseboards: 120-180F+ supply

Building Science 2008

Combo Systems

- Condensing Tankless heaters
 - Beware minimum output
 - Most units are 15 to 35 kBtu/hr minimum
 - Eg. no lower than a furnace
- Unless storage is provided, min output equals min output of heating system
 - This means duct sizes, coils, etc.

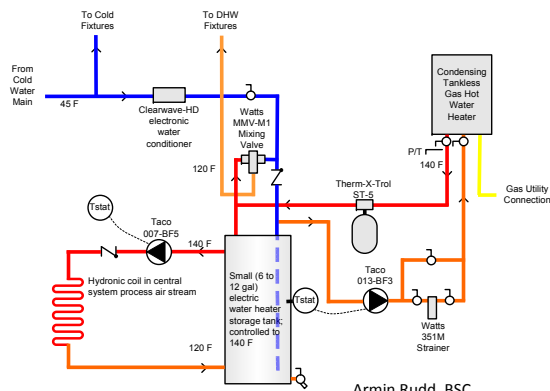

Combo System Warning

- Provide buffer capacity, eg a storage tank
- Limits short-cycling when loads are small (eg 10-30% of min. boiler output)
 - Allows for very small demand systems
- Buffer tank avoids cold slug complaints

Condensing Tankless Gas Hot Water Heater Application
In Combination Space and Domestic Hot Water Heating System

Combi

- small buffer tank
- Adds some standby losses

Low standby loss

Marathon™ Point-of-Use...With The All Plastic Tank

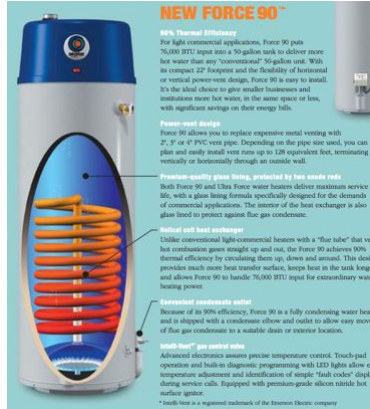

Available in 15 and 20 Gallon Electric Models

- ▶ Residential Use: Lifetime Limited Tank Warranty, 1
- ▶ Light Duty Commercial Use: 10-Year Limited Tank

- Seamless, blow-molded, polybutylene tank – impervious to rust and corrosion
- Multiple layers of filament wound fiberglass give the tank unmatched strength
- Polyurethane Envirofoam™ insulation helps reduce energy consumption
- The most energy efficient in its class
- Recessed brass drain valve is out of the way of brooms and scrubbers
- Tough molded polyethylene outer shell resists dents and scratches
- Bowl shaped bottom allows complete sediment draining
- High temperature polysulfone dip tubes
- All plastic tank eliminates the need for an anode rod

Newer Condensing Tanked systems

State Force 90

NEW FORCE 90™

90% Thermal Efficiency
For light commercial applications, Force 90 puts 90,000 BTU input into a 50-gallon tank to deliver more hot water than any "conventional" 50-gallon tank. With its compact 22" footprint and the flexibility of horizontal or vertical placement design, Force 90 is easy to install. It's the ideal choice to give smaller businesses and institutions more hot water in the same space or less, with significant savings on their energy bills.

Power-vent design
Force 90 allows you to replace expensive metal venting with 2" x 4" of PVC vent pipe. Depending on the pipe size used, you can plan and install vent runs up to 128 equivalent feet, terminating vertically or horizontally through an outside wall.

Power-venting glass lining, protected by brass anode rods
Both Force 90 and Ultra Force water heaters deliver maximum service life, with a glass lining formula specifically designed for the demands of commercial applications. The interior of the heat exchanger is also glass lined to protect against flue gas condensation.

Water level float control
Unlike conventional light-commercial heaters with a "blue tube" that is lost combustion gases straight up and out, the Force 90 achieves 90% thermal efficiency by circulating them up, down and around. This design provides much more heat transfer surface, keeps heat in the tank longer and allows Force 90 to handle 70,000 BTU input for extraordinary water heating power.

Commercial condensate water
Because of its 90% efficiency, Force 90 is a fully condensing water heater and is shipped with a condensate drain and valve to allow easy removal of flue gas condensate to a suitable drain or exterior location.

Touch-free™ gas burner valves
Advanced electronic pressure precise temperature control, touch-pad operation and built-in diagnostic programming with LED lights allow temperature adjustment and identification of simple "flash codes" (display during service calls). Equipped with precision-grade silicon nitride hot surface ignitor.

*Health-Safe is a registered trademark of the Invenor™ Division, Invenor.

Allows for direct connection to air handler.

No additional controls or plumbing

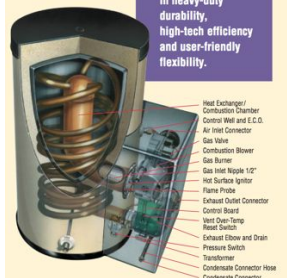

May be lowest cost solution for pretty high efficiency in small apartments, homes, with few cooling needs.

Rinnai

3TAHB Series Hydronic Furnace
Part of the Rinnai Tankless Heating System
PATENT PENDING

FEATURES

- Four models covering a range of heating capacities
 - 27,100 to 90,200 BTU/hour
- Multi-position (upflow, downflow, horizontal left, horizontal right) without modifications
 - Modifiable for side-entry return air
- Low-flow, high-head pump custom designed to work with Rinnai's tankless water heaters
- Integrated control board with learning algorithm
- No combustion air infiltration losses when used with a Rinnai tankless water heater
- Four selectable heat slower off delay times
- Multi-speed motors (ECM)
- Strong 20-gauge steel cabinet
 - Galvanized, painted
 - Fully insulated cabinet
 - Low 34 inch profile
- Multi-position control box
- Designed for serviceability
- Schrader valves to purge air from the system
- Integral filter rack with filter
- Fan motor with ECM technology

The optimum in hydronic technology, the newly designed Rinnai multi-position hydronic furnaces offer a unique solution for a wide variety of small- and medium-sized residential and light commercial applications. They are compact and ready to fit in tight spaces which may include, but not limited to, attics, basements, closets, crawlspaces, and utility rooms.

Intelligent Microprocessor Controller
The 3TAHB units are equipped with an intelligent microprocessor control that allows for domestic hot water priority and adapts to available hot water flow for space heating by automatically regulating the pump and fan sequence to maximize comfort.

Fine Tuned to Work with Rinnai Tankless Water Heaters
These unique hydronic furnaces are designed to work in combination with our line of Rinnai tankless water heaters to deliver heating capacities that cover a wide spectrum of residential and light commercial heating applications. When combined, the units form the Rinnai Tankless Heating System, the first matched, tankless hydronic heating solution in the industry!

* NOTE: The unit is not designed to be installed on its back or face down.

This product is manufactured in a facility registered by U.S. to ISO 9001.

600000060 (7/2010)

Fan coils

- Operate at over 100F (38C) air temperatures to avoid “cold blow” drafts
- Ensure low return (under 120F) to get condensation in condensing boilers
- Lower speed jet (200 fpm), high supply location recommended
 - Higher supply temperatures if you don't do this

Heat Pumps

- Neither create or destroy heat, but move it around
- Require input energy just like any other pump
- Need
 - **Source** of thermal energy
 - **Sink** of thermal energy
- Sources (inside=cooling, outside=heating)
 - Air (“Air source”)
 - Ground (“ground source”)
 - Soil, Groundwater, or Surface water (eg lake)
 - Wastehat in building via exhaust air or drain water

12-12-06

60

Heat Pumps

- Use compressors, and refrigerant ("Freon")
- All use *internal heat exchangers* to transfer hot or cold refrigerant to water or air
- Terminology
 - "Air to air heat pump" = "air-source"
 - "Water-to-water heat pump"
 - "air conditioning"
 - Water to air
 - Ground source
 - "Geothermal"

12-12-06

Heat Pumps: AC and Fridge

Heat Pump Efficiency vs Lift

Split System Heat Pump and Reject/Collect in same box

- Compressor, and DX coils in one enclosure

Cooling

- Most cooling equipment is a heat pump
 - uses the interior as a source (collection) and
 - Outside as the sink (rejection)
- Heat pumps do cooling and heating
- Challenge to get single speed units to be appropriate for both

12-12-06

65

Dehumidification

- Cooling will often require supplemental dehumidification
- This requires cold surface: eg fan coils, not radiant ceilings/floors!
- Separate dehumidifier is common
- Multi-speed AC may be sufficient in marginal cases (including mini-split)

Heat pumps in heating mode

- Major reduction in heat output as outdoor temperature drops
- COP drops as outdoor temperature drops
- Typically designed for a “balance point” and then used electric “strip” heat
- Modern design avoids strip heat

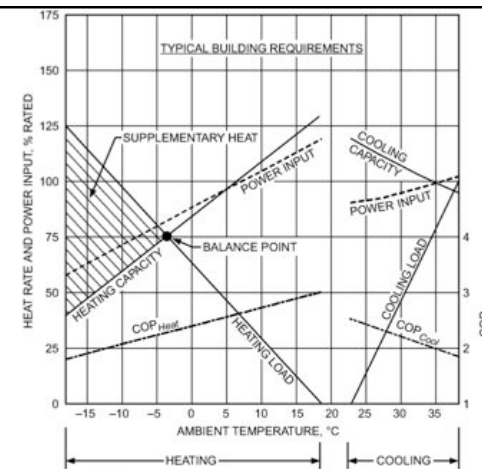

Fig. 11 Operating Characteristics of Single-Stage Unmodulated Heat Pump

Heat+cool: Ducts provides distribution, can add ventilation, no DHW

Split Heat Pumps

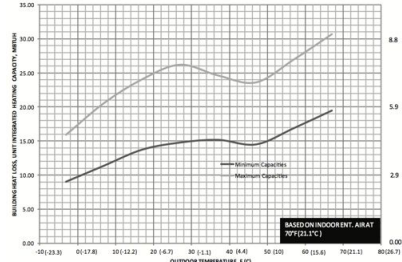

- An option for Zone 3-4?
 - Eg Portland Seattle Tacoma 20 F *design* temp
- 2 ton HP produce about 16 kBtu/hr @20F

SSZ160241A* / CA*F3636*6A* + TXV / MBE1600**-1 e.g., Goodman SEER16 model

Seasonal COP 3-3.5, cooling included, standard equipment, <<\$3000

Some split-systems might work

Expensive. Min. cooling capacity of about 14 kBtu/hr
Min heat output of about 10-15 kBtu/hr @ cold temperatures

Ductless Mini-split

Modulating= follows load profile
Available in small sizes
BUT, don't provide ventilation or DHW

Measured Mini-split performance

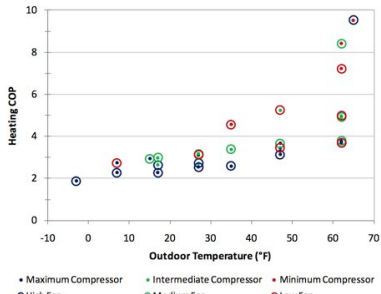

Figure 5. Fujitsu 12RLS steady-state heating COP (70°F return temperature)

Winkler, J. Laboratory Test Report for Fujitsu 12RLS and Mitsubishi FE12NA Mini-Split Heat Pumps, NREL, Golden, CO. 2011.

Modulating / staged heat pump

- Lose less output as temperature drops
- Always loose efficiency (COP drops)
- Usually avoid electric heat, or supplement it

Example

MODEL: ASU9RLS2

AFR		Indoor temperature							
500		60		65		70			
Outdoor temperature	*FDB	*FDB	TC	IP	TC	IP	TC	IP	
	-5	-7	14.7	1.97	14.3	2.01	14.0	2.05	
5	3	16.1	1.98	15.7	2.02	15.4	2.06		
14	12	16.8	1.91	16.4	1.95	16.0	1.99		
23	19	16.3	1.84	17.9	1.88	17.5	1.92

50	47	25.5	1.94	24.9	1.98	24.3	2.02		
59	50	26.5	1.95	25.6	1.99	25.2	2.03		

AFR: Air Flow Rate (CFM)
TC: Total Capacity (Btu/hr)
IP: Input Power (kW)

16 kBtu/hr output @14F and COP=2.4

Mini-split distribution

- Heat distribution from 7kBtu/hr head?
- Aesthetics of exposed heads
- Some hidden "slim duct" units exist but efficiency suffer
- Open doors between spaces really helps

Distribution from point sources

- Mini-split first floor only (heating)
- Installed 2nd floor for cooling
- Measured temperature distribution from bedrooms to hallway
- Work by Kohta Ueno / Dan Bergey
- Carter Scott NZEH
- unoccupied

Temperature Distribution

- little temperature variation (+/2F)

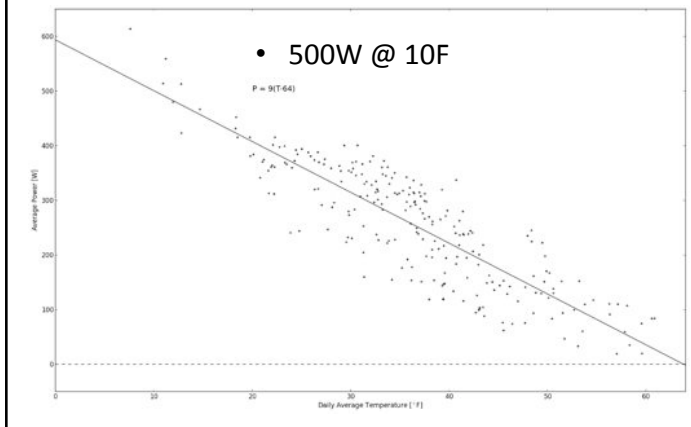

Distribution

- SW/S bedroom was sometimes 2-3F warmer than hall
- Solar heating through SHGC=0.2 windows

Measured power draw

- 500W @ 10F

More Distribution

- 2400 sf high performance home in Philly
- Sunny day, near peak cooling load
- 2 ton AC (about 2x what is needed)
- Temperature variations exceed 5F/3C from thermostat
- Solar gain in Southwest Bedroom results in peak load

Variable Refrigerant Volume (VRV)

Emerging alternate systems

- Variable speed outdoor unit (VRV) (18 & 24)
- Two-speed indoor fancoil for ducts (ECM fan)
- 18 kBtu/hr model
 - Operates at 600/420 cfm
 - 12 kBtu/hr low speed
 - Up to 20 kBtu/hr heating

Split System Air Conditioners
Air Handling Unit

FTQ-PA + RZQ-P9

DAIKIN AC (AMERICAS), INC.

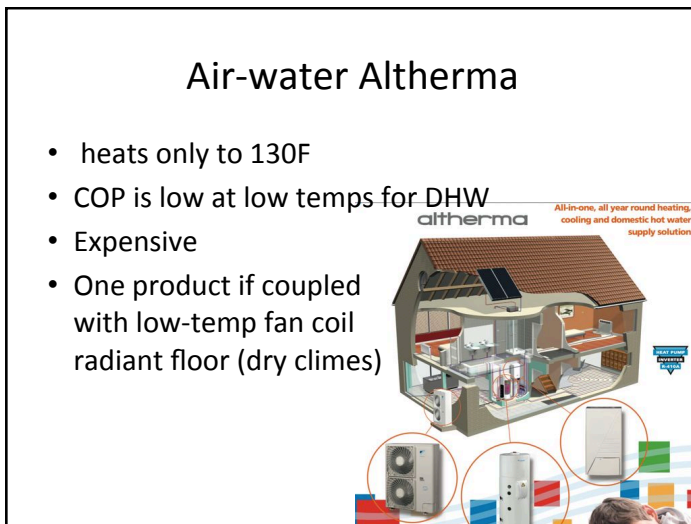

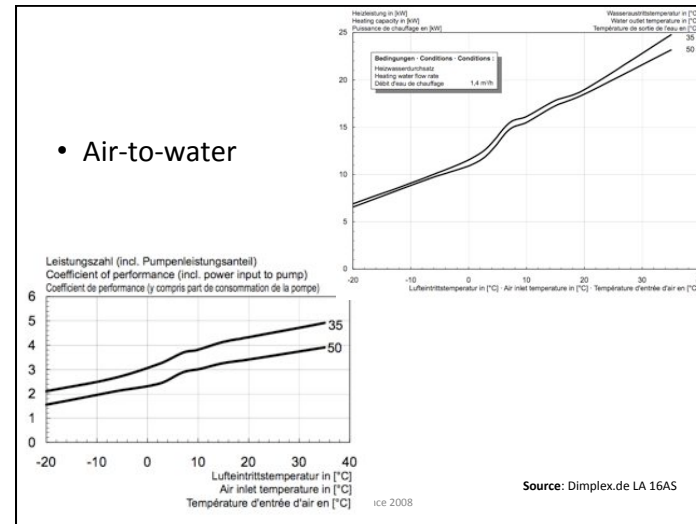

Chillers

- Air-water heat pumps used for cooling water
- Big units use cooling towers
- Usually large buildings
- “reverse-cycle chiller” is another name for a water-to-air heat pump

Air to water heat pump

- Often need DHW top-up
- Do heat/cooling with AHU

Air-water Altherma

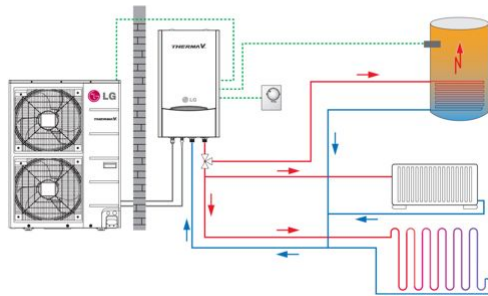

- heats only to 130F
- COP is low at low temps for DHW
- Expensive
- One product if coupled with low-temp fan coil radiant floor (dry climes)

Numerous systems available

- but not in Canada/US ☹

Therma V + Radiator + Underfloor Heating + Sanitary Tank

CO2 Refrigerant air-to-water

- allows true hot water (>140F/60C)
- Operates to low (-10F/-25C) temperatures
- Cant buy in north America ☹

Ground Source Heat Pump

- A water-to-air or water-to-water heat pump with with collection / rejection in ground
- Pumps can consume lots of energy!

12-12-06

GSHP Geothermal

- Can buy small capacity systems (eg 1.5 – 2 tons)
- Many benefit for water storage tank
- Cost is challenging: just heat cool but often total system cost of \$20K
- Desuperheaters don't help DHW much

Electric Resistance

- Electric heat
 - Cheap to buy, high operating cost, maybe hi GHG
- Baseboard / Cove
 - Impact on space design
- Radiant heat mats (heat does not rise)
 - Floor/ceiling
 - 10-15 W/sf capacity
 - Need 300-600W per room (30-60 sf)

Pellet Boilers

- Can be an option for heating and opt. DHW
- 8-50 kBtu/hr, modulating, some sealed combustion

Domestic Hotwater

Difficult to separate from design of HVAC in low-load *residential* buildings

DHW – Health/Safety

- Require water temps over 120 F (50C)
 - 66 °C (151 °F): Legionellae die within 2 minutes
 - 60 °C (140 °F): Legionellae die within 30 minutes
 - 55 °C (131 °F): Legionellae die within 5 to 6 hours
 - 50 °C (122 °F): They can survive but do not multiply
- Showers are primary indoor residential vector
- Scalding 130F
 - 10 / 30 seconds for child/adult 3rd deg burns

DHW

- Heat pumps
 - difficult to achieve >120F efficiently
 - Need to use R134a/R507 to get hot
- Gas combustion
 - High capacity and >130F easy
- Electric
 - Expensive, lower recovery
 - Point-of-use requires large kW service

Heat-pump water heaters

Performance: “depends”

- Work well in warm spaces
 - Eg boiler rooms
- Dehumidify basements in summer
- Cool basements in winter
- Steal heat from house
 - Is free heat available?

Add-on Heat pump

-

North Road Technologies LLC

GEYSER COP as a Function of Ambient and Water Temperatures

DHW efficiency

- Condensing can happen when low entering temperature
- Long pipe runs can eat up energy
 - Small pipes help
- Heat Pump Water Heaters
 - Depend on where you are

Distribution of Thermal Energy

Air-based Energy Delivery

- Heat Capacity: Energy required to raise the temperature or released when a material is cooled
 - Air heat capacity: 0.240 Btu/lb/F.
 - Air density: 0.074 lbs/cf @ room temp = 0.018 Btu/cf/F
 - 1 cfm = 60 cubic feet per hour
 - So... heat delivered per cfm
 - = $60 \times 0.018 \approx 1.1 \text{ Btu/hr/cfm/F (1.2 W/lps/C)}$
 - **Usually use 1.05 for cool air, 1.08 for warm air**

Building Science 2008

Air-based 2

- Cooling air supply 55 F, and room air 75 F
 - $1.1 (75-55) = 22 \text{ Btu/hr/cfm}$
 - Need more flow for cooling than heating
- Heating return 70 F
 - Furnace 120 F: $1.0 * 50 = 50 \text{ Btu/hr/cfm}$
 - Heat pump 100 F: $1.0 * 30 = 30 \text{ Btu/hr/cfm}$
 - Therefore need 5/3 more airflow for low temp air

Building Science 2008

Fans

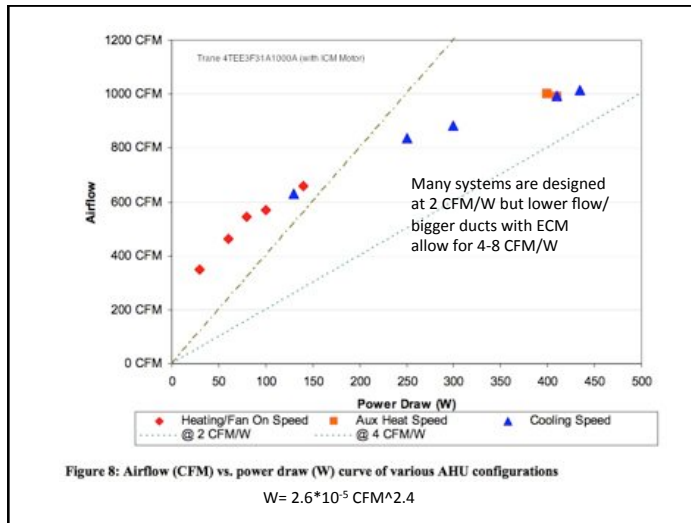

- Efficiency
 - Rating: Watt per cfm (or cfm per Watt)
 - Higher pressure = higher power requirement
 - Power (W) = Flow rate * Δ pressure / efficiency
 - HP = cfm * Inch Water / (6356 * eff)
 - Efficiency: 0.4 (good) to 0.65 (best)
- Energy: 0.25 to 1.5 W/cfm for ducted systems
- Reduce pressure or flow required = direct energy savings

Building Science 2008

Fan Laws

1. Increase RPM = direct CFM increase
 2. Static Pressure increases RPM²
 3. Horsepower increases with RPM³
- Double pressure means 1.41 times RPM
 - Requires 2.8 times horsepower
- **Energy saving designs use low CFM and/or Low ΔP**

Building Science 2008

Reducing duct friction

- Reduce velocity
 - Increase duct area!
- Fittings are major source of friction
 - Larger radius bend
- Simplify duct runs if possible

Building Science .com

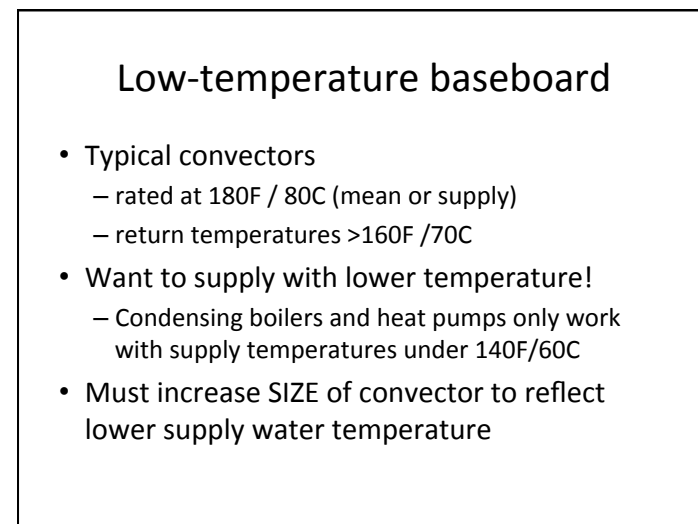

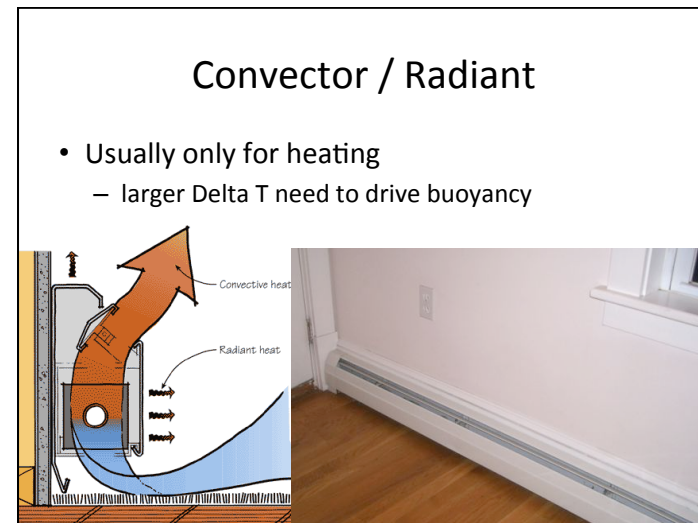

Water-Based Systems

- Water moves...
 - 500 Btu/hr/GPM/F
 - 375 Btu/hr/GPM/F (Glycol)
 - Radiant floor
 - 100 F supply 90 return <= 5000 Btu/hr/GPM
- Example: 30 000 Btu/hr
 - Furnace: @ 50 Btu/hr/cfm → 600 cfm (300W)
 - Heat pump @ 30 Btu/hr/cfm → 1000 cfm (500W)
 - Radiant 5000 Btu/hr/GPM → 6 GPM (40W)
- But, good design/spec can deliver 600 cfm@150W

Energy of distribution

- Furnace: 1000 cfm 60 000 Btu/hr
 - Fan 300-800W (=1000-2700 Btu/hr)
 - 1.5 to % of energy delivered
- Heat Pump 1000 cfm 30 000 Btu/hr
 - Fan 300-800 W (4 to 9%)
- Radiant floor
 - Pump 85W 10 GPM 50 000 Btu/hr (0.6%)
- **Distribution energy can vary by 5X to 15X**

Convactor retrofit- see TRV

Henry Gifford!

TRV (very simple)

- Thermostatic Radiator Valves
- Automatically open and close to meet setpoint temperature with no power required

Radiant floors in low-load houses

- Radiant floors wont heat up enough to be noticed
 - This is not barefoot friendly
- Still, zero-noise, no maintenance

Radiant Floors

Emission plates under wood

- Not as effective as topping.
Requires higher water temperatures.

Heat Exchange from Surfaces

- Example: 80F (27C) floor, 72F (22C) room air
 - 15.2 Btu/hr/ft² heating
- Example: 60F (15.5C) ceiling, 74F (23C) room air
 - 26.6 Btu/hr/ft² cooling (500 sf/ton)
- Example: 68F floor, 74F air (1500 sf/ton)

	heating		cooling	
	Btu/hr/ft ² /F	W/m ² K	Btu/hr/ft ² /F	W/m ² K
floor	1.9	11	1.2	7
wall	1.4	8	1.4	8
ceiling	1.1	6	1.9	11

Radiant Floor “Self-control”

- Low temperature radiant has some self control
- *Huge* practical control and comfort benefit in low heat flux radiant floor and ceilings
- If room rises 1F @ low load, heat output drops 38%!

Heating Power	Room 70F Floor Temperature	21.1C Celsius	Power output change for 1F/C room temperature change	Percentage change	
Btu/hr/ft ²	W/m ²	(F)	Btu/hr/ft ²	W/m ²	Output
5	15.8	72.6	1.9	11	38%
10	31.5	75.3	1.9	11	19%
15	47.3	77.9	1.9	11	13%

Building Science

Ventilation

- ## Intro
- Require fresh air for health and humidity
 - ASHRAE 62.2 latest
 - 7.5 cfm/person + 0.03 /sf
 - Therefore
 - 3 BDR / 2000 sf = 90 cfm
 - Was 50 cfm until recently

- Mid-scale HRV
- Emerging tech
- 200-600 cfm
- Need to watch fan energy!

HRV/ERV

- Heat Recovery Ventilator
 - This is a ventilation system that recovers heat from the exhaust air and transfers to incoming air
- Enthalpy/Energy Recovery Ventilator
 - Transfer heat and humidity from incoming to exhaust
- Both, beware poor electric motor efficiency
 - Aim for less than 1 W/cfm

Heating Cooling + Ventilation

12-12-06

Multi-unit Issues

- Metering: per suite or per building
- Fuel-Source: Gas or all-electric
 - Carbon? Dollars? Energy?
- DHW or just space heat?
- Is Cooling necessary?
- Grouping: Central, unit, or mix?
- Equipment owned per suite or per building?
- Perceived access to apt issues?

Central vs Distributed

- Central systems often
 - reduce capital cost per unit output of *plant*
 - Increase distribution costs dramatically
 - Increase distribution energy losses
 - Decrease redundancy
 - Increase complexity
 - Make sub-metering expensive/difficult
 - Take advantage of load diversity

DHW Distribution

- Distribution losses
 - Can be significant for long runs
 - Recirculation pumps
 - Large pipe diameters store lots of water

Schools

- E.g Double-loaded corridor or exterior corridor
- One wall + roof exposed/class
- Small systems work well per class
 - mini-split + HRV
 - Ventilation control / class
 - Individual control of temperature!
 - Lots of redundancy, easy to maintain

Conclusions

- This is still complex
- No simple or easy solutions

Choices

- Furnace is still a good choice if you have natural gas and loads over 20 kBtu/hr
 - Choose smallest condensing unit, lock out high fire
- Combo Systems
 - Use high-efficiency DHW system to provide heating
 - Space heat can be fan coil, radiator, floor
 - Can be integrated into ventilation, filtration
 - Add cooling coil
- Size of duct/coil often fixed by cooling system

Cooling

- Need variable speed / staged small units
 - Ductless mini-split on upper floor only?
- Separate dehumidifier likely required
 - Could be DHW heat pump!
